

Step-by-Step Guide: Deploy React (Vite) App to Vercel

This guide explains the simplest and easiest way to deploy your React application using Vercel. Follow each step carefully.

Step 1: Prepare Your Project

- Make sure your React app is working properly on your local machine.
- If you are using Vite, confirm the project runs using: `npm run dev`
- Make sure package.json contains a build script: `npm run build`

Step 2: Push Your Project to GitHub

- Create a repository on GitHub.
- Open your project folder in VS Code.
- Run the following commands in terminal:
 - `git init`
 - `git add .`
 - `git commit -m 'initial commit'`
 - `git branch -M main`
 - `git remote add origin YOUR_REPO_URL`
 - `git push -u origin main`

Step 3: Deploy Using Vercel (Easiest Method)

- Go to <https://vercel.com>
- Sign up or log in using your GitHub account.
- Click on 'Add New Project'.
- Select your GitHub repository.
- Vercel will automatically detect it as a Vite or React project.
- Make sure the following settings are correct:
 - Build Command: `npm run build`
 - Output Directory: `dist`

- Click Deploy.

Step 4: Access Your Live Website

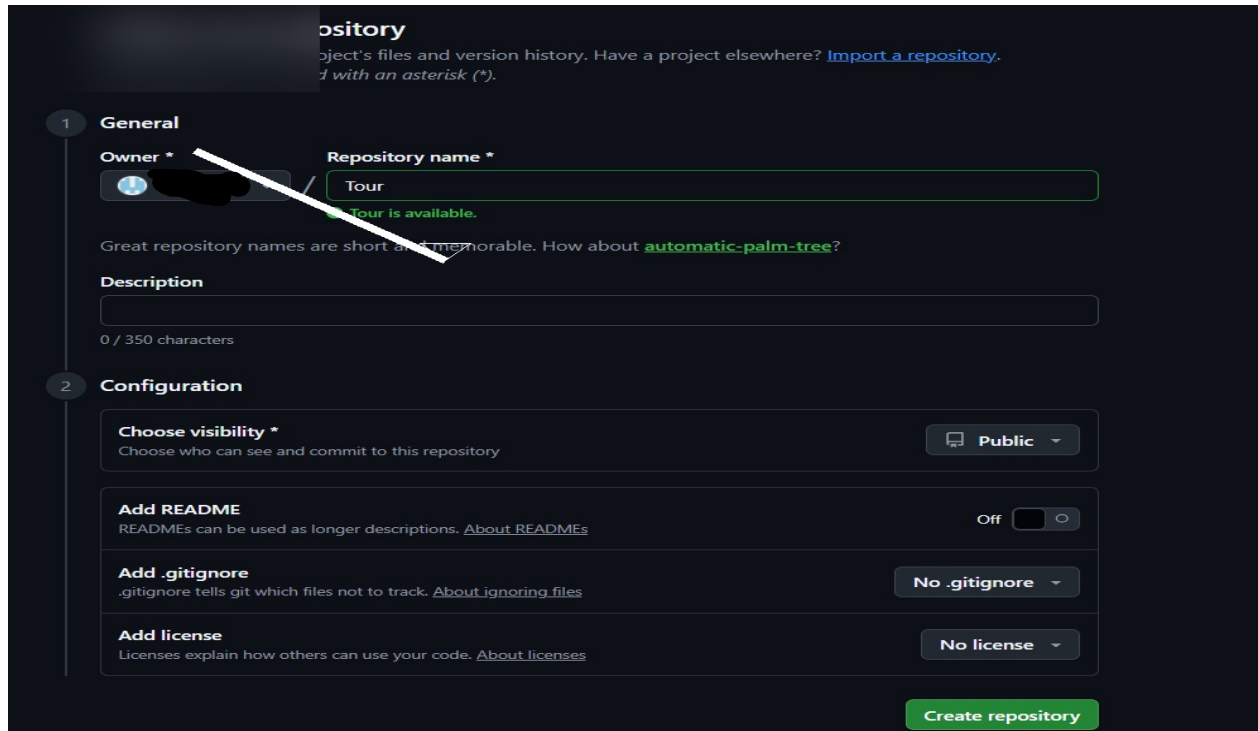

- After deployment completes, Vercel will generate a live URL.
- It will look like: `https://your-project-name.vercel.app`
- You can share this link with anyone.
- The link does not expire unless you delete the project.

Optional: Auto Deployment

- Every time you push new changes to GitHub, Vercel automatically redeploys your project.
- No need to deploy manually again.

Deploying a React (Vite) App to Vercel – Step by Step

Step 1: Create a new repository on GitHub.

The screenshot shows the GitHub 'Create new repository' page. It is divided into two sections: '1 General' and '2 Configuration'. In the 'General' section, the 'Repository name' field contains the text 'Tour', and a green message below it says 'Tour is available.' A white arrow points from the 'Owner' field to the 'Repository name' field. The 'Description' field is empty. In the 'Configuration' section, the 'Choose visibility' dropdown is set to 'Public'. The 'Add README' section has a toggle switch set to 'Off'. The 'Add .gitignore' dropdown is set to 'No .gitignore'. The 'Add license' dropdown is set to 'No license'. At the bottom right, there is a green 'Create repository' button.

Repository

project's files and version history. Have a project elsewhere? [Import a repository.](#)
and with an asterisk (*).

1 General

Owner * **Repository name ***

 Tour is available.

Great repository names are short and memorable. How about [automatic-palm-tree?](#)

Description

0 / 350 characters

2 Configuration

Choose visibility *
Choose who can see and commit to this repository

 **Public** ▼

Add README
READMEs can be used as longer descriptions. [About READMEs](#)

Off ☐

Add .gitignore
.gitignore tells git which files not to track. [About ignoring files](#)

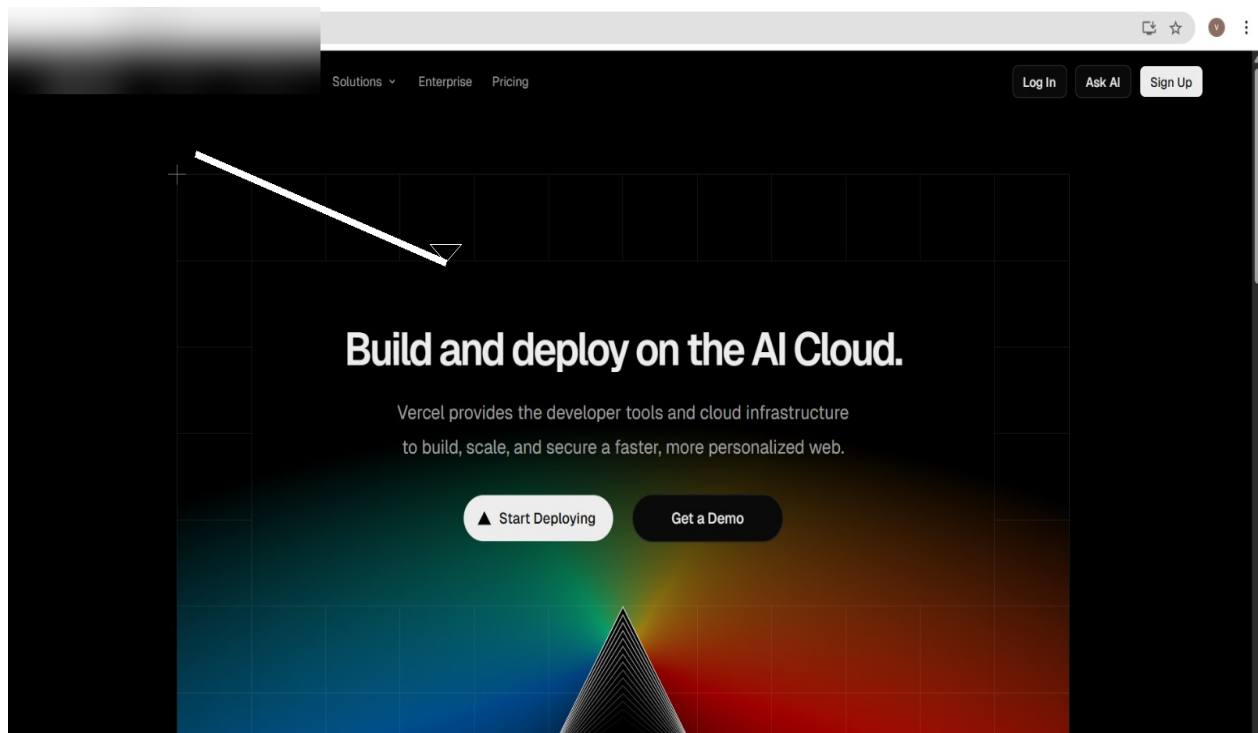

No .gitignore ▼

Add license
Licenses explain how others can use your code. [About licenses](#)

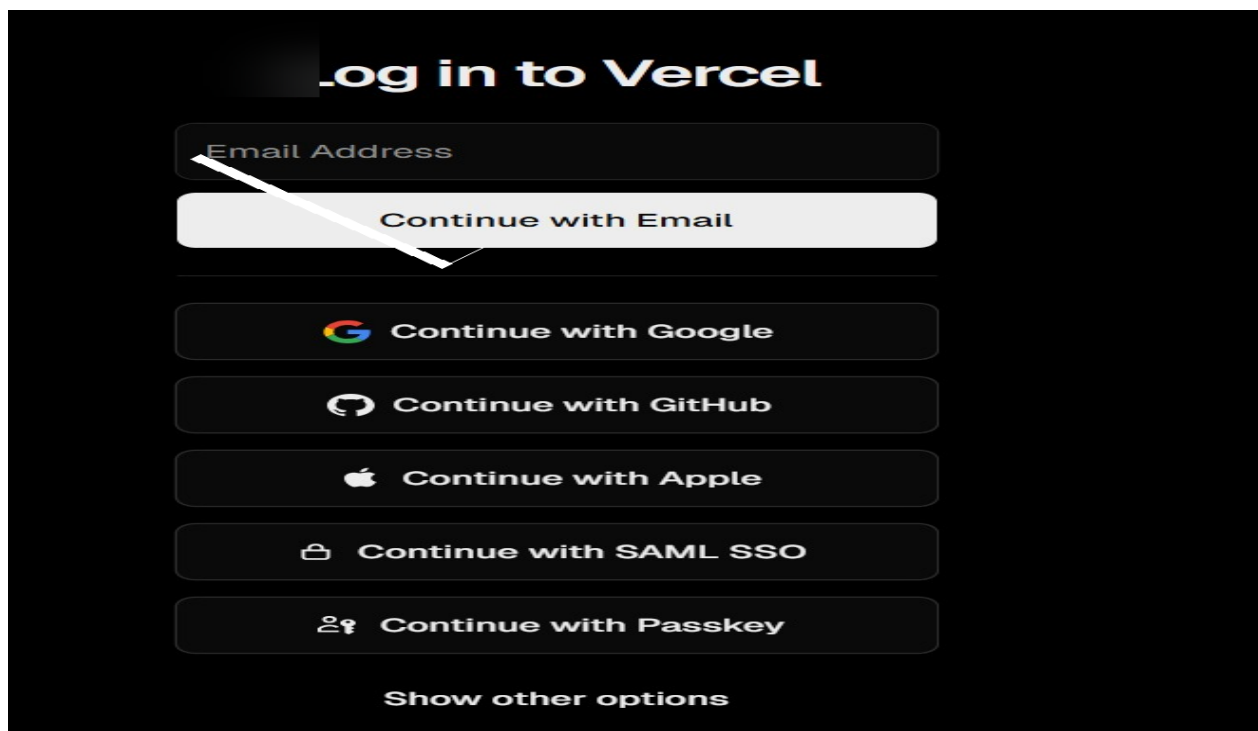

No license ▼

Create repository

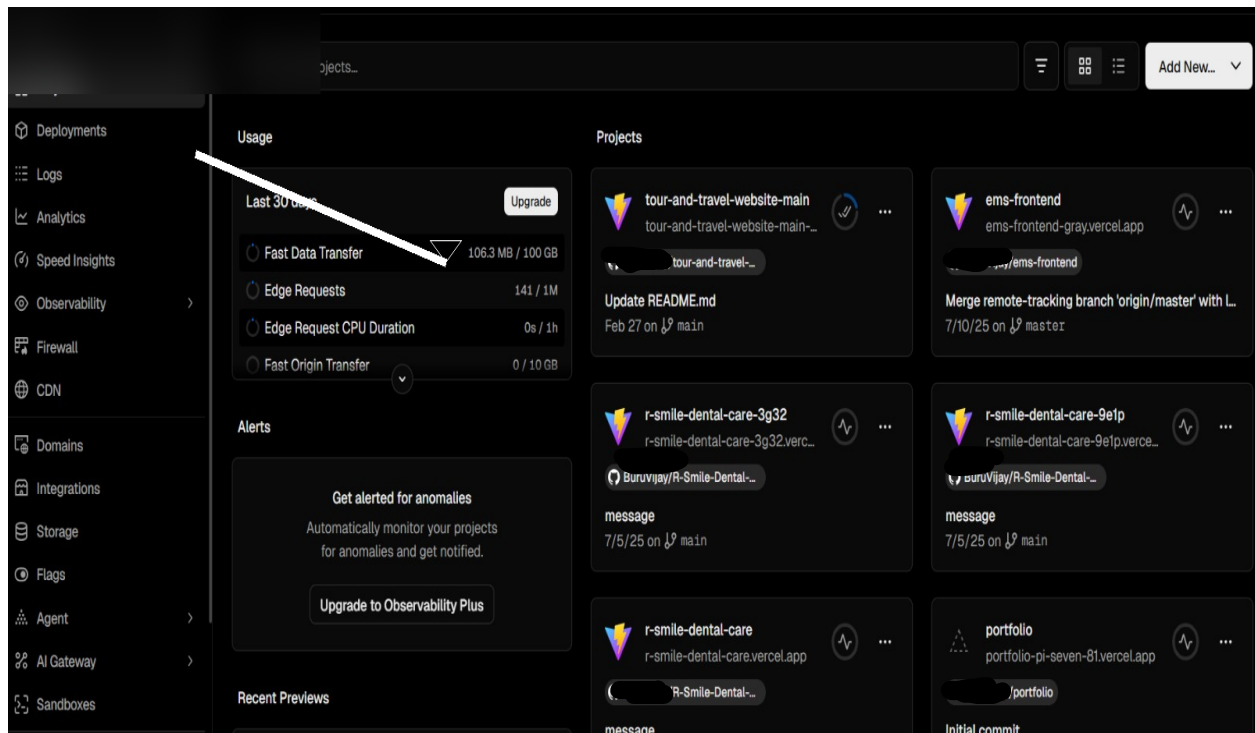

Step 2: Open Vercel website.

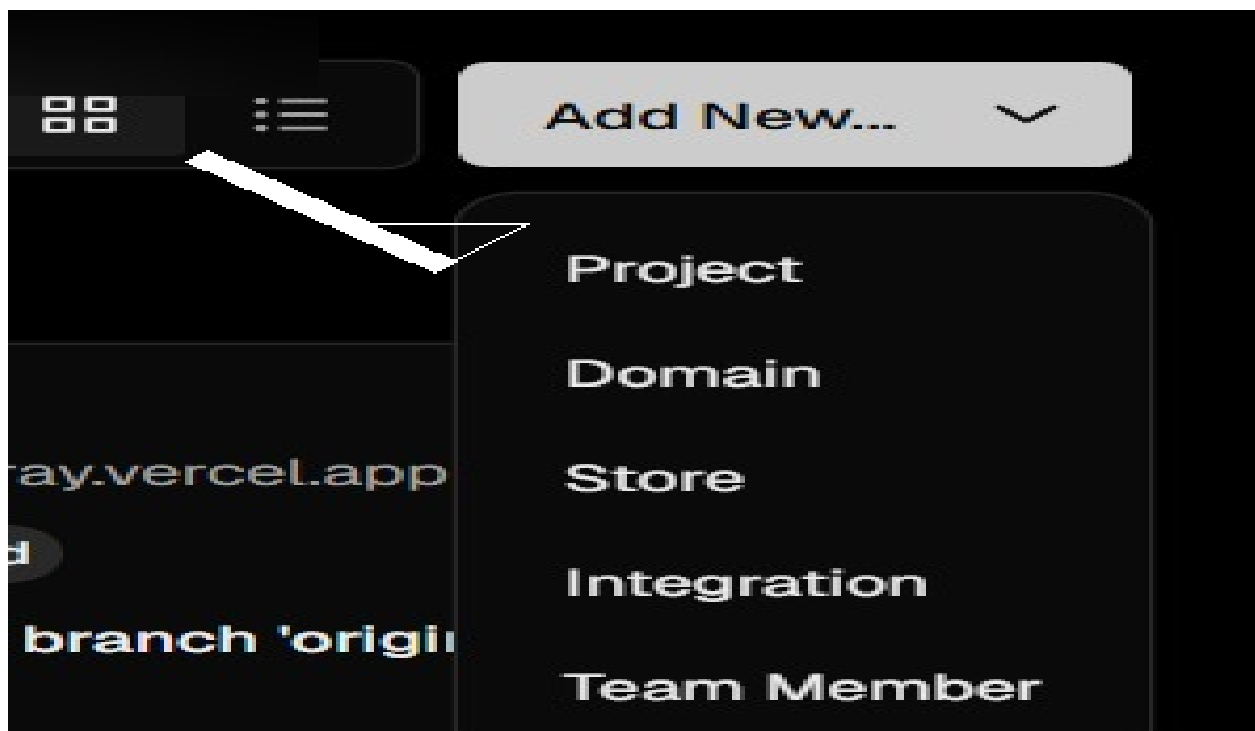

Step 3: Log in to Vercel using GitHub.

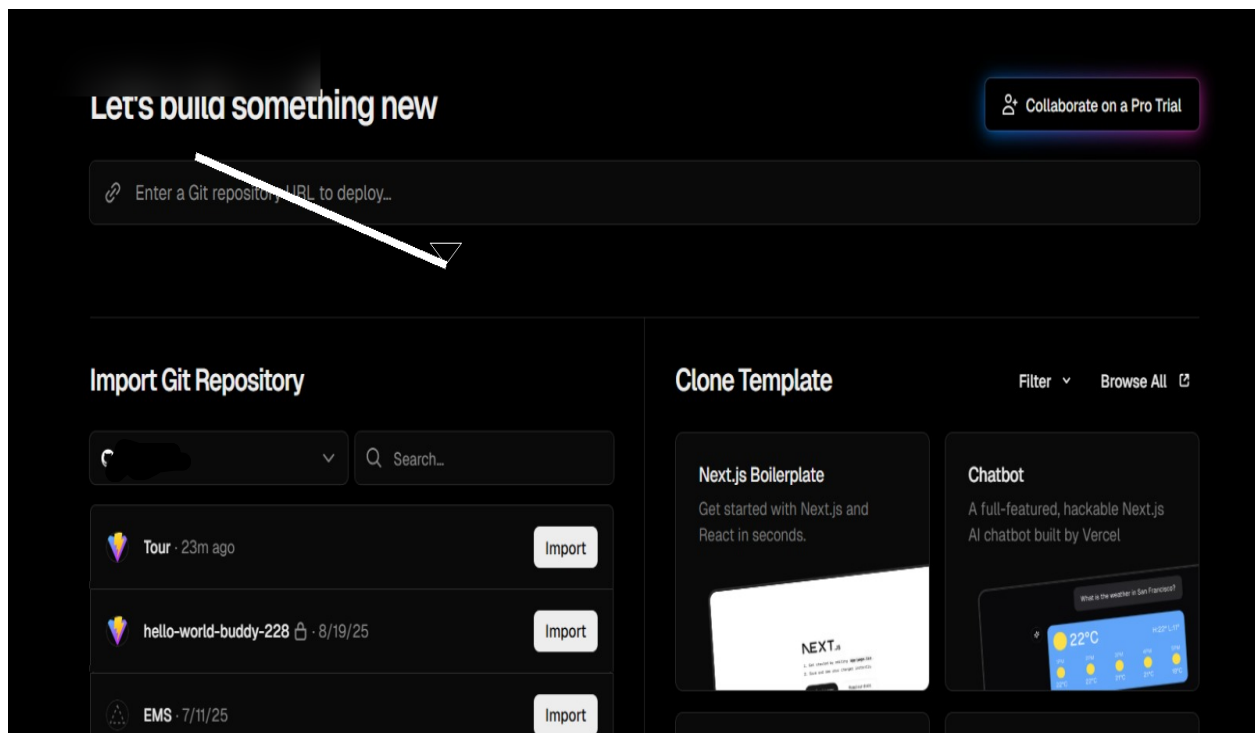

Step 4: Vercel dashboard after login.

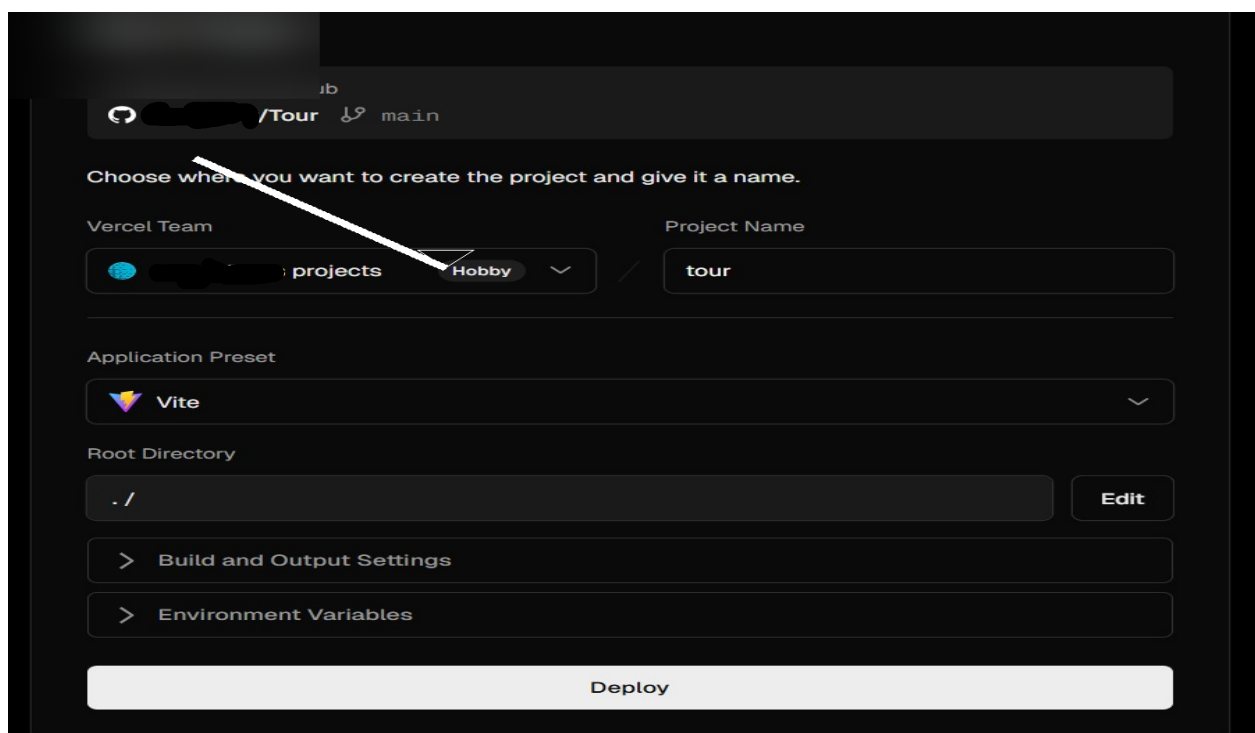

Step 5: Click 'Add New' and choose Project.

Step 6: Import your GitHub repository.

Step 7: Configure project settings (Vite detected).

Step 8: Deployment success and live website.
